

Curriculum Errata Notice

2026 Level III CFA Program

Issue date: May 2026

Welcome to the Curriculum Errata Notice.

We review and confirm potential errors to ensure you can study with confidence. This notice includes reported issues that could affect your understanding, such as miscalculations, incorrect explanations, or mislabeled exhibits.

For the most current information, regularly check the Learning Ecosystem (Canvas) or this document. Due to the nature of our publishing process, corrections may not appear immediately in our printed materials.

In this document, you will find:

- Table of Contents by Course
- New Errata marked since the last notice
- Full list of errata organized by Course

If you spot something that seems incorrect, please let us know: cfainst.is/errata. Every report is carefully reviewed and investigated by our subject matter experts.

Good luck with your studies!

2 Apr 2026	Asset Allocation 5: Asset Allocation with Real-World Constraints	5.09 Short-Term Shifts in Asset Allocation	Page 343 Bullet 3	it rises when put option buying increases and falls when call buying activity increases.	it rises when put option buying activity (either calls or puts) increases.
13 Apr 2026	Derivatives and Risk Management 1: Options Strategies	1.09 Implied Volatility and Volatility Skew	Page 49 Exhibit 27	<p>Delete from curriculum:</p> <p>So, for example, if an investor buys an ATM one-month (21-day) straddle using puts and calls on the DAX, in order for the strategy to be profitable at expiration, the index must move up or down by at least 2.68%. The investor can compare this price movement needed to reach breakeven with the DAX' s realized volatility over similar time horizons in the past. If such a price change is considered reasonable, then the investor can elect to implement the strategy.</p>	
21 Apr 2026	Portfolio Management Pathway 3: Active Equity Investing: Portfolio Construction	3.02 Building Blocks of Active Equity Portfolio Construction	Page 126 Exhibit 5	Active risk is a measure of the volatility of portfolio returns relative to the volatility of benchmark returns.	Active risk is a measure of the volatility of the difference between portfolio returns and benchmark returns.

22 Apr 2026	Portfolio Management Pathway 4: Liability-Driven and Index-Based Strategies	4.06 Bond Indexes	Page 249 Case Study	Cindy Cheng, a portfolio manager based in Hong Kong SAR, has established the All Asia Dragon Fund, a fixed-income fund designed to outperform the Markit iBoxx Asian Local Bond Index (ALBI).	Cindy Cheng, a portfolio manager based in Hong Kong SAR, has established the All Asia Dragon Fund, a fixed-income fund designed to track the Markit iBoxx Asian Local Bond Index (ALBI).
23 Apr 2026	Asset Allocation 1: Capital Market Expectations, Part 1: Framework and Macro Considerations	Practice Problems	Page 57 Questions 1 and 2	<p>Moved the following from Question 1 to the beginning of Question 2</p> <p>Wuyan reports that after repeatedly searching the most recent 10 years of data, she eventually identified variables that had a statistically significant relationship with equity returns. Wuyan used these variables to forecast equity returns. She documented, in a separate section of the report, a high correlation between nominal GDP and equity returns. Based on this noted high correlation, Wuyan concludes that nominal GDP predicts equity returns. Based on her statistical results, Wuyan expects equities to underperform over the next 12 months and recommends that the firm underweight equities.</p> <p>Commenting on the report, John Tommanson, an investment adviser for the firm, suggests extending the starting point of the historical data back another 20 years to obtain more robust statistical results. Doing so would enable the analysis to include different economic and central bank policy environments. Tommanson is reluctant to underweight equities for his clients, citing the strong performance of equities over the last quarter, and believes the most recent quarterly data should be weighted more heavily in setting capital market expectations.</p>	

23 Apr 2026	Asset Allocation 1: Capital Market Expectations, Part 1: Framework and Macro Considerations	Practice Problems	Page 58 Questions 3 and 4	Move the following from Question 3 to the beginning of Question 4. At the investment committee meeting, the firm's chief economist predicts that the economy will enter the late expansion phase of the business cycle in the next 12 months.

<p>18 Dec 2025</p>	<p>4: An Overview of Private Wealth Management</p>	<p>4.05 The Impact of Taxation and Inflation</p>	<p>Page 255 Question 2</p>	<p>For incomes between EUR500,000 and EUR1,000,000, the tax rate is 40%. For the first EUR500,000, the tax is EUR150,000, and for the next EUR200,000 the tax rate is 40% x (EUR700,000 - EUR500,000) = EUR80,000. The total tax payable is then EUR150,000 + EUR80,000 = EUR230,000, and the average tax rate is 32.86%.</p>	<p>For incomes between EUR500,000 and EUR1,000,000, the marginal tax rate is 40% and the base tax is EUR116,000. Accordingly, for an income of EUR700,000 the tax payable is EUR116,000 + 0.4*(EUR700,000 - EUR500,000) = EUR116,000 + EUR80,000 = EUR196,000, which equates to an average tax rate of EUR196,000/EUR700,000 = 28%</p>																

<p>18 Dec 2025</p>	<p>4: An Overview of Private Wealth Management</p>	<p>4.05 The Impact of Taxation and Inflation</p>	<p>Page 255 Question 3</p>	<p>Considering the expected investment income of EUR10,000 in interest income and EUR5,000 in dividend income, the total income is EUR715,000. For the first EUR500,000 in ordinary income tax, the tax is EUR150,000, and for the next EUR215,000, the tax rate is 40% x (EUR715,000 - EUR500,000) = EUR86,000. The total tax payable is then EUR150,000 + EUR86,000 = EUR236,000. Thus, 33.01% of the total income of EUR715,000 is paid in taxes.</p>	<p>Note that the total expected investment income is EUR10,000 (interest income) + EUR5,000 (dividend income) = EUR15,000, and that EUR15,000 + EUR700,000 = EUR715,000, which still falls between EUR500,000 and EUR1,000,000 – so Ms. Kozłowska is still in the same marginal tax bracket. Consequently, the marginal tax on the EUR15,000 of investment income is 40%, or 0.4*EUR15,000 = EUR6,000. The total tax due then becomes EUR196,000 + EUR6,000 = EUR202,000, or EUR202,000/EUR715,000 = 28.25%</p>
--------------------	--	--	--------------------------------	--	--

<p>18 Dec 2025</p>	<p>4: An Overview of Private Wealth Management</p>	<p>4.05 The Impact of Taxation and Inflation</p>	<p>Page 255 Question 4</p>	<p>In this scenario, the investment income is taxed differently than ordinary tax rates, as part of the interest income is excluded from ordinary income tax rates and dividend income is taxed at a lower rate than the marginal tax rate. Of the total interest income of EUR10,000, EUR5,000 is excluded from taxation. This means that the taxable income is reduced from EUR715,000 to EUR710,000 after accounting for the interest income exclusion. Two different tax rates apply to this taxable income.</p> <p>i. The ordinary income, which comprises the regular income (EUR700,000) and the taxable portion of the interest income (EUR5,000), is taxed according to the table above. Meanwhile, the dividend income of EUR5,000 is subject to a flat tax of 15%.</p> <p>ii. The ordinary income tax amounts to EUR150,000 for the first EUR500,000 and EUR82,000 for the remaining EUR205,000 (including the taxed portion of her interest income). This is calculated as $40\% \times (EUR705,000 - EUR500,000) = EUR82,000$, resulting in a total income tax of EUR232,000.</p> <p>For the dividend income of EUR5,000, there is a 15% tax, equating to EUR750. In total, she pays EUR232,000 in ordinary</p>	<p>Recall that we have EUR10,000 in interest income and EUR5,000 in dividend income. EUR10,000-EUR5,000 = EUR5,000 is taxable interest income and gets added to our earnings income of EUR700,000 for a total of EUR705,000. The tax on this portion is EUR116,000 + 0.4*(EUR705,000-EUR500,000) = EUR116,000+0.4*EUR205,000 = EUR116,000+EUR82,000 = EUR198,000. To this we add the tax on dividend income: 0.15*EUR5,000 = EUR750. Accordingly, the total tax due is EUR198,000 + EUR750 = EUR198,750 which implies a total tax rate of EUR198,750/EUR715,000 = 27.80%.</p>
--------------------	--	--	--------------------------------	---	--

				income tax and EUR750 in investment income tax on the dividends, with a total tax liability of EUR232,750. She pays 32.55% of her total income of EUR715,000 in taxes, and her taxable income is EUR710,000.	
5 Dec 2025	4: An Overview of Private Wealth Management	4.05 The Impact of Taxation and Inflation	Page 264 Question 3 Solution	How much purchasing power have taxes eroded? Answer: Taxes eroded the equivalent of EUR49,601 in purchasing power.	How much purchasing power have taxes eroded? Answer: Taxes eroded the equivalent of EUR49,610 in purchasing power.
25 Aug 2025	4: An Overview of Private Wealth Management	4.06 Individual Investors and Investment Policy Statements	Page 287 Practice Problems, Question 1	Which of the following investment parameter categories of the IPS is least likely to include Cree's preference for investments that reflect his environmental and social concerns? A. Asset class preference B. Other investment preferences C. Constraints	Which of the following investment parameter categories of the IPS is most likely to include Cree's preference for investments that reflect his environmental and social concerns? A. Investment parameters B. Investment objectives C. Duties and responsibilities
3 Feb 2026	4: An Overview of Private Wealth Management	Practice Problems	Page 288 Above Question 7	Additionally, Patel plans to buy a vacation home to enjoy his early retirement years and expects to hold the home for 10 years. His budget for the vacation home is approximately EUR1.7 million. He expects an 8% annual pretax appreciation in the value of his vacation home and expects to pay capital gains tax of 20% on the sale of this vacation home. Patel is considering selling half of his securities portfolio to fund the vacation home purchase.	Additionally, Patel plans to buy a vacation home to enjoy his early retirement years and expects to hold the home for 3 years. His budget for the vacation home is approximately EUR1.7 million. He expects an 8% annual pretax appreciation in the value of his vacation home and expects to pay capital gains tax of 20% on the sale of this vacation home. Patel would finance the purchase of this home purely with securities sales.

<p>3 Feb 2026</p>	<p>4: An Overview of Private Wealth Management</p>	<p>Practice Problems</p>	<p>Page 289 Question 8</p>	<p>Determine whether Patel should sell half of his securities portfolio to buy the vacation home.</p>	<p>Determine whether Patel should sell half of his securities portfolio to buy the vacation home, assuming that he is interested in maximizing future value. Also assume that if he does not buy the home he will liquidate half the securities in 10 years' time and any gains will be subject to capital gains tax. Also assume that there are no other expenses on the purchase of the home (e.g., all other expenses will be encompassed in the purchase price). Lastly, ignore the dividend yield on reinvested dividends.</p>

22 Aug 2025	4: An Overview of Private Wealth Management	4.06 Individual Investors and Investment Policy Statements	Page 296 Solution to 22	The correct answer is B. The “Other investment preferences” category typically includes legacy holdings such as shares of stock of a former employer or an investment the client wishes to make countering the wealth manager’s advice. A is incorrect	A is correct. The choice of an investment’s asset class is least likely to reflect a client’s preferences for environmentally and socially oriented investments. B is incorrect

<p>3 Mar 2026</p>	<p>6: Trading Costs and Electronic Markets</p>	<p>6.03 Development of Electronic Markets</p>	<p>Page 422 Above Lesson 4 heading</p>	<p>Add to curriculum: Example 2 Electronic Trading and Transaction Costs 1. Describe the impact of electronic trading on transaction costs. Solution: Growth in electronic trading has resulted in greater trade process efficiencies and reduced transaction costs for investors. Electronic systems are much cheaper to operate than floor-based systems (requiring less physical space and fewer exchange personnel). These systems can operate on a close-to-continuous basis at far greater scale and scope and at much faster speeds than humans. Process efficiencies from electronic trading have led to significant decreases in bid-ask spreads, which have lowered transaction costs for investors.</p>

Derivatives and Risk Management

Revised	Module	Lesson	Location (PDF)	Replace	With
8 Aug 2025	1: Options Strategies	1.02 Position Equivalencies	Page 5 Second paragraph under “Synthetic Forward Position”	Consider an investor who buys an at-the-money (ATM) call and simultaneously sells a put with the same strike and the same expiration date. Whatever the stock price at expiration, one of the two options will be in the money.	Consider an investor who buys an at-the-money (ATM) call and simultaneously sells a put with the same strike and the same expiration date. Technically, it should be referring to ATM spot or ATM forward. However, for practice purposes, there is usually not much distinction in the mechanics. Whatever the stock price at expiration, one of the two options will be in the money.
New: 13 Apr 2026	1: Options Strategies	1.09 Implied Volatility and Volatility Skew	Page 49 Below Exhibit 27	Delete from curriculum: So, for example, if an investor buys an ATM one-month (21-day) straddle using puts and calls on the DAX, in order for the strategy to be profitable at expiration, the index must move up or down by at least 2.68%. The investor can compare this price movement needed to reach breakeven with the DAX’s realized volatility over similar time horizons in the past. If such a price change is considered reasonable, then the investor can elect to implement the strategy.	

<p>17 Feb 2026</p>	<p>2: Swaps, Forwards, and Futures Strategies</p>	<p>2.08 Using Derivatives in Asset Allocation, Part 2</p>	<p>Page 118-119 Exhibit 7</p>	<p>Equity swap 1: TMM receives the total return of the S&P 500 and makes a floating payment tied to the market reference rate (MRR) minus the agreed-on spread, both on a notional principal of \$27 million.</p> <p>Equity swap 2: TMM receives the total return of the SPSC and makes a floating payment tied to the MRR minus the agreed-on spread, both on a notional principal of \$3 million.</p>	<p>Equity swap 1: TMM receives the total return of the S&P 500 and makes a floating payment tied to the market reference rate (MRR) plus the agreed-on spread, both on a notional principal of \$27 million.</p> <p>Equity swap 2: TMM receives the total return of the SPSC and makes a floating payment tied to the MRR plus the agreed-on spread, both on a notional principal of \$3 million."</p>
<p>8 Aug 2025</p>	<p>3: Currency Management: An Introduction</p>	<p>3.07 Economic Fundamentals, Technical Analysis and the Carry Trade</p>	<p>Page 171 End of second paragraph under Exhibit 6</p>	<p>One guide to the riskiness of the carry trade is the volatility of spot rate movements for the currency pair; all else equal, lower volatility is better for a carry trade position.</p>	<p>One guide to the riskiness of the carry trade is the volatility of outright forward (not spot) rate movements for the currency pair; all else equal, lower volatility is better for a carry trade position. This is an important distinction: although spot rates are generally highly correlated with forward rates this is not always the case. For example, Argentina had a currency board where the spot rate was fixed at 1 ARS per USD but the outright forward rates were very volatile.</p>

8 Aug 2025	3: Currency Management: An Introduction	3.08 Volatility Trading	Page 173 Second Paragraph	One simple option strategy that implements a volatility trade is a straddle, which is a combination of both an at-the-money (ATM) put and an ATM call. A long straddle buys both of these options. Because their deltas are -0.5 and $+0.5$, respectively, the net delta of the position is zero; that is, the long straddle is delta neutral.	One simple option strategy that implements a volatility trade is a straddle, which is a combination of both an at-the-money (ATM) put and an ATM call. A long straddle buys both of these options. <i>Because their deltas are -0.5 and $+0.5$, respectively.</i> Note: deltas for European-style put options range from -1 (deep-in-the-money put) to 0 (deep-out-of-the-money put), and from 0 to $+1$ for calls. Deltas of 0.5 and $+0.5$ occur when the strikes are ATM on a forward basis. When the net delta of the position is zero, the long straddle is delta neutral.
19 Aug 2025	3: Currency Management: An Introduction	3.09 Forward Contracts, FX Swaps, and Currency Options	Page 180, Table and Paragraph under table, inside Executing a Hedge	JPY/HKD 14.4/14.42 Thus, the spot leg of the swap would be to buy JPY800,000,000 at the mid-market rate of 10.81 JPY/HKD.	JPY/HKD 14.40 /14.42 Thus, the spot leg of the swap would be to buy JPY800,000,000 at the mid-market rate of 14.41 JPY/HKD.

<p>22 Oct 2025</p>	<p>3: Currency Management: An Introduction</p>	<p>3.09 Forward Contracts, FX Swaps, and Currency Options</p>	<p>Page 180, Hedge #2</p>	<p>... Because the EUR is the base currency in the HKD/EUR quote, this means using the bid side for both the spot rate and the forward points when calculating the all-in forward rate: $9.0200 + 173 _ 10,000 = 9.0373$ The spot leg of the swap—buying back EUR8,000,000 to settle the outstanding forward transaction—is also based on the bid rate of 9.0200. This is because Yang is selling an amount larger than EUR8,000,000 forward, and the all-in forward rate of the swap is already using the bid side of the market (as it would for a matched swap). Hence, to pick up the net increase in forward EUR sales, the dealer Yang is transacting with would price the swap so that Yang also has to use bid side of the spot quote for the spot transaction used to settle the maturing forward contract.</p>	<p>... Because the EUR is the base currency in the HKD/EUR quote, this means using the ask side for the spot rate and the bid side for the forward rate when calculating the all-in forward rate: $9.0200 + 173 _ 10,000 = 9.0373$ The spot leg of the swap—buying back EUR8,000,000 to settle the outstanding forward transaction—is also based on the ask rate of 9.0210. This is because Yang is buying EUR (the base currency) to unwind her short position, so she must pay the dealer’s ask. The forward leg — selling more than EUR8,000,000 forward —is executed at the forward bid rate (spot bid + forward bid points), as Yang is selling EUR forward. Hence, the correct pricing uses the spot ask rate for unwinding the maturing forward contract and the forward bid rate for rolling into the new, larger hedge.</p>
<p>2 Sept 2025</p>	<p>3: Currency Management: An Introduction</p>	<p>3.10 Currency Management Strategies</p>	<p>Page 186 Example 5 – Solution to 3</p>	<p>Remove the following text: Moreover, the GBP has depreciated against the MXN, because the MXN/GBP spot rate declined between one month ago and now, which will also add to the negative roll yield.</p>	

<p>20 Aug 2025</p>	<p>3: Currency Management: An Introduction</p>	<p>Solutions</p>	<p>Page 236 Question 33</p>	<p>All-in forward rate = $0.8914 + (30/10,000) = 0.8944$ $USD2,500,000 / 0.8944 = EUR2,795,169.95.$ 2. Buy USD2,500,000 at the spot rate to offset the USD sold in Step 1 above. Buying the US dollar against the euro means selling euros, which is the base currency in the USD/EUR spot rate. Therefore, the bid side of the market must be used to calculate the inflow in euros. $USD2,500,000 / 0.8875 = EUR2,816,901.41.$ 3. Therefore, the net cash flow is equal to $EUR2,795,169.95 - EUR2,816,901.41$, which is equal to a net outflow of $EUR21,731.46.$ To maintain the desired hedge, Delgado will then enter into a new forward contract to sell the USD2,650,000. There will be no additional cash flow today arising from the new forward contract.</p>	<p>All-in forward rate = $1.174 + (10/10,000) = 1.1724$ $USD2,500,000 / 1.1724 = EUR2,132,378.03.$ 2. Buy USD2,500,000 at the spot rate to offset the USD sold in Step 1 above. Buying the US dollar against the euro means selling euros, which is the base currency in the USD/EUR spot rate. Therefore, the bid side of the market must be used to calculate the inflow in euros. $USD2,500,000 / 1.575 = EUR2,159,827.21.$ 3. Therefore, the net cash flow is equal to $EUR2,132,378.03 - EUR2,159,827.21$, which is equal to a net outflow of $EUR27,449.18.$ To maintain the desired hedge, Delgado will then enter into a new forward contract to sell the USD2,650,000. There will be no additional cash flow today arising from the new forward contract.</p>

Portfolio Management Pathway

Revised	Module	Lesson	Location (PDF)	Replace	With
19 Feb 2026	1: Index-Based Equity Strategies	1.02 Factor-Based Strategies	Page 4	Although the concepts underlying factor investing, sometimes marketed as “smart beta,” have been known for a long time, investors’ use of the technique increased dramatically over time.	The concepts underlying factor investing, sometimes marketed as “smart beta,” have been known for a long time, and investor adoption has increased dramatically over time.
20 Feb 2026	1: Index-Based Equity Strategies	1.06 Tracking Error Management	Page 22 Potential Causes of Tracking Error and Excess Return	Tracking error in an indexed equity fund can arise for several reasons. A major reason involves the fees charged. Although tracking error is expressed as an absolute value, fees are always negative because they represent a cost and drive down the excess return. Therefore, higher fees will contribute to lower excess returns and higher tracking error.	Tracking error in an indexed equity fund can arise for several reasons. Constant proportional fees contribute to negative excess return (they reduce alpha) but do not contribute to tracking error. As tracking error is the standard deviation of the return difference, it is unaffected by a constant. Although tracking error is expressed as an absolute value, fees are always negative because they represent a cost and drive down the excess return.

13 Aug 2025	2: Active Equity Investing: Strategies	2.08 Activist Strategies	Page 72 Paragraph above Exhibit 21	Exhibit 21 shows the steps of identifying an activist investment target company. Target companies feature slower revenue and earnings growth than the market, suffer negative share price momentum, and have weaker-than-average corporate governance.	Exhibit 21 shows some of the factors activist investors usually consider when evaluating potential targets. To derive the Z-score, the statistical distribution for each factor across the full company universe is computed and then standardized against that distribution. The resulting standardized scores show that activist targets tend to have: slower revenue and earnings growth than the market; weaker share-price momentum and return on equity than peers; and poorer-than-average corporate-governance metrics. Notably, these patterns, visible a year before the activist campaign, continue up to the event date.
12 Aug 2025	3: Active Equity Investing: Portfolio Construction	3.02 Building Blocks of Active Equity Portfolio Construction	Page 124 Paragraph above Exhibit 4	Exhibit 4 shows the cumulative value of \$100 invested in both the Russell 1000 Growth Index and the Russell 1000 Value Index over a 10-year period ending in 2020.	Exhibit 4 shows the cumulative value of \$100 invested in both the Russell 1000 Growth Index and the Russell 1000 Value Index over a 10-year period ending in 2006.
New: 21 Apr 2026	3: Active Equity Investing: Portfolio Construction	3.02 Building Blocks of Active Equity Portfolio Construction	Page 126 Exhibit 5	Active risk is a measure of the volatility of portfolio returns relative to the volatility of benchmark returns.	Active risk is a measure of the volatility of the difference between portfolio returns and benchmark returns.
5 Mar 2026	3: Active Equity Investing: Portfolio Construction	3.08 Allocating the Risk Budget	Page 158 Question 2	What portion of the total portfolio risk is explained by the Market factor?	What portion of the total portfolio variance is explained by the Market factor?

<p>5 Mar 2026</p>	<p>3: Active Equity Investing: Portfolio Construction</p>	<p>3.08 Allocating the Risk Budget</p>	<p>Page 159 Question 2 Solution</p>	<p>91% of total portfolio risk is explained by the Market factor.</p>	<p>In this context, we use the betas as the weights in equation (11) and take the benchmark weights (betas) to be zero.</p> <p>To understand the rationale behind this, consider a 1-factor model (like CAPM) - if we have a beta of 1.5, with the factor volatility of 10% and a portfolio volatility of 20%, then the active return variance is given by:</p> $(1.5^2) \times (0.1^2) = 0.0225$ <p>And so the total variance explained would be $0.0225/0.2^2= 56.25\%$</p> <p>In the problem above, 91% of the total portfolio variance is explained by the Market factor.</p>
-------------------	---	--	-------------------------------------	---	--

<p>3 Mar 2026</p>	<p>3: Active Equity Investing: Portfolio Construction</p>	<p>3.10 Implicit Cost-Related Considerations</p>	<p>Page 172 In Exhibit 22, before Example 7</p>	<p>Removed the following paragraph and related footnote from the curriculum:</p> <p>A study by AQR Capital Management “Factor Momentum Everywhere”, 2019 documents robust persistence in the returns of equity factor portfolios. This persistence is exploitable with a time-series momentum trading strategy that scales factor exposures up and down in proportion to their recent performance. Factor timing in this manner produces economically and statistically large excess performance relative to untimed factors. Taken alongside the evidence of time series momentum in commodity, bond, and currency factors, the findings of momentum among equity factors—in the time series, in the cross section, and around the world—support the conclusion that factor momentum is a pervasive phenomenon in financial markets. 40</p> <p>Footnote: 40 Peter Lynch, while managing the highly successful Magellan Fund, generated a 2% gross monthly alpha on average (less than \$1 million per month) assets under management of \$40 million during his first five years of tenure and a 0.20% alpha per month during his last five years on assets of about \$10 billion (more than \$20 million per month). It is likely that the portfolio management approach evolved as the asset base grew.</p>

15 Sept 2025	4: Liability-Driven and Index-Based Strategies	4.03 Managing the Interest Rate Risk of Multiple Liabilities	Page 218 Duration Matching – Last sentence	With multiple liabilities, matching money durations is useful because the market values and cash flow yields of the assets and liabilities are not necessarily equal.	With multiple liabilities, matching money durations is useful because the market values and cash flow yields of the assets and liabilities are not necessarily equal. Unlike the single liability case, where the asset portfolio's modified duration (money duration) must be slightly greater than that of the liability, immunization against multiple liabilities requires that the asset portfolio's money duration (BPV) match that of the liabilities. The match may be slightly above or below, provided it is the closest available to the liability BPV.
15 Sept 2025	4: Liability-Driven and Index-Based Strategies	4.03 Managing the Interest Rate Risk of Multiple Liabilities	Page 223 Above Derivatives overlay	Add above Derivatives Overlay: As described in the case study, in addition to matching money duration, immunization against multiple liabilities requires an asset portfolio with convexity which exceeds that of the liabilities but must have the lowest possible convexity available in order to minimize the structural risk to the strategy.	
New: 22 Apr 2026	4: Liability-Driven and Index-Based Strategies	4.06 Bond Indexes	Page 249 Case Study	Cindy Cheng, a portfolio manager based in Hong Kong SAR, has established the All Asia Dragon Fund, a fixed-income fund designed to outperform the Markit iBoxx Asian Local Bond Index (ALBI).	Cindy Cheng, a portfolio manager based in Hong Kong SAR, has established the All Asia Dragon Fund, a fixed-income fund designed to track the Markit iBoxx Asian Local Bond Index (ALBI).
19 Feb 2026	5: Yield Curve Strategies	5.03 Yield Curve Strategies	Page 292	Exhibit 10 shows a general decline in bond yields, referred to as a bull market, since 2007.	Exhibit 1 shows a general decline in bond yields, referred to as a bull market, since 2007.

21 Aug 2025	5: Yield Curve Strategies	5.03 Yield Curve Strategies	Page 296 End of second paragraph in Example 7	We can therefore solve for the modified duration of the 2-year zero as 1.96 (= $2/1.02$) and the 10-year zero as 9.62 (= $10/1.04$), so net portfolio duration equals zero, or $(124.6 - 25.41 \times 1.96) + (-25.4/124.6 - 25.41 \times 9.62)$.	We can therefore solve for the modified duration of the 2-year zero as 1.96 (= $2/1.02$) and the 10-year zero as 9.62 (= $10/1.04$), so net portfolio duration equals zero, or $[(124.6/(124.6 - 25.41)) \times 1.96] + [(-25.41/(124.6 - 25.41)) \times 9.62]$.
19 Aug 2025	5: Yield Curve Strategies	Solutions	Page 331 Solutions – Problem 21	C is Correct. The bear steepening in A involves a rise in the 10-year yield-to-maturity more than in the 5-year yield-to-maturity, causing portfolio loss.	A is correct. The bear steepening in A involves a rise in the 10-year yield-to-maturity more than in the 2 -year yield-to-maturity, causing portfolio loss.

3 Feb 2026	1: Private Investments and Structures	Practice Problems	Page 40 Above table	MSUMC notes the following basic facts about Glidestone’s Fund 1. The fund invested EUR15 million per year at the beginning of each of Years 1–4, followed by cash inflows of EUR30 million per year at the ends of each of Years 4–7.	MSUMC notes that investors contributed EUR15 million per year into Glidestone’s Fund 1 at the start of years 1-4, which were used for investments, which were used for investments. The fund received cash inflows of \$30Million from its investments at the end of years 4-6 and \$10Million at the end of Year 7.
3 Feb 2026	1: Private Investments and Structures	Practice Problems	Page 40 Below table	Remove from curriculum: MSUMC personnel note that Fund 1 distributed EUR100 million to its investors over time while the fund generated EUR120 million of cash inflows.	
3 Feb 2026	1: Private Investments and Structures	Practice Problems	Page 40 Question 5	Which of the following most closely approximates the ROI and IRR of Glidestone’s Fund 1 over its seven-year life? A. ROI = 2×; IRR = 10.4%. B. ROI = 2×; IRR = 18.9%. C. ROI = 3×; IRR = 18.9%.	Which of the following most closely approximates the ROI and IRR for the investors in Glidestone’s Fund 1 over its seven-year life? A. ROI = 2×; IRR = 10.4%. B. ROI = 2×; IRR = 16.6% . C. ROI = 3×; IRR = 16.6% .

3 Feb 2026	1: Private Investments and Structures	Practice Problems	Page 40 Question 7	Discuss why Glidestone's NAV increases by EUR5 million between the ends of Years 3 and 4 using observations about fund distributions.	Discuss why Glidestone's NAV increases by EUR5 million between the ends of Years 3 and 4 using observations about fund distributions given that there was no increase for the NAV on any individual investment made by the fund across these years.
3 Feb 2026	1: Private Investments and Structures	Practice Problems	Page 43 Question 5 Solution	B is correct. Glidestone's Fund 1 invested EUR60 (= 15 × 4 years) million and received EUR120 (= 30 × 4 years) million, so ROI is 2× (= 120 ÷ 60). The IRR is solved using either a spreadsheet or financial calculator IRR function as =IRR({-15,-15,-15,-15,30,30,30,30},0), which yields a solution of 18.9%. A is incorrect because the IRR of 10.4% assumes that all the cash outflows of EUR60 million occur at the beginning of the investment life cycle and that all the cash inflows of EUR120 million occur at the end of the investment life cycle. C is incorrect because ROI of 3× is incorrect.	B is correct. Investors in Glidestone's Fund 1 invested EUR60 (= 15 × 4 years) million and received cash and terminal value of EUR120 (= 30 × 4 years) million, so ROI is 2× (= 120 ÷ 60). The IRR is solved using either a spreadsheet or financial calculator IRR function as =IRR({-15,-15,-15,-15,10,30,30,50},0), which yields a solution of 16.6% . Note that the year 7 number is the terminal value of EUR12 million plus the distribution of EUR30 million = EUR50 million. A is incorrect because the IRR of 10.4% assumes that all the cash outflows of EUR60 million occur at the beginning of the investment life cycle and that all the cash inflows of EUR120 million occur at the end of the investment life cycle. C is incorrect because ROI of 3× is incorrect.

28 Aug 2025	2: General Partner and Investor Perspectives and the Investment Process	2.03 Investor (LP) Perspectives, Fees and Performance Measurement	Page 60 Estragon SA Fund's Clawback Provision Case Study	The fund's excess returns in Year 4 were EUR140 million (= EUR200 million – EUR60 million), and Estragon collected EUR28 million (= EUR140 million × 0.20) in carried interest at the end of Year 4. However, the fund earned no additional return in the three subsequent years. The total carried interest at the end of fund's life could be no more than EUR19 million [= 0.20 × (EUR200 million – EUR105 million)]. So, the clawback provision mandates that Estragon must return EUR9 million (= EUR28 million – EUR19 million) to its LPs given the overpayment of carried interest early in the fund's life, since one highly successful investment was followed by three failures.	The fund's excess returns in Year 4 were EUR175 million (= EUR200 million – EUR25 million) , and Estragon collected EUR35 million (= EUR175 million × 0.20) in carried interest at the end of Year 4. However, the fund earned no additional return in the three subsequent years. The total carried interest at the end of fund's life could be no more than EUR19 million [= 0.20 × (EUR200 million – EUR105 million)]. So, the clawback provision mandates that Estragon must return EUR16 million (= EUR35 million – EUR19 million) to its LPs given the overpayment of carried interest early in the fund's life, since one highly successful investment was followed by three failures.

10 Oct 2025	3: Private Equity	Practice Problems	Page 147 Solution to 8	The prior fractional ownership is equal to 13.33% (= 2.5 ÷ 18.75). Post-money valuation is given as EUR50 million and pre-money valuation is equal to EUR47.5 million (= 50 – 2.5). New investor equity is given as Estragon’s planned investment of EUR2.5 million. Thus, the fractional ownership is equal to approximately 17.7% (= 13.33% × (47.5/50) + (2.5/50)).	The prior fractional ownership is equal to 13.33% (= 2.5 ÷ 18.75). Post-money valuation is given as EUR50 million and pre-money valuation is equal to EUR45 million (= 50 – 5). New investor equity is given as Estragon’s planned investment of EUR2.5 million plus an additional EUR2.5 million from another investor, for a total of EUR5 million . Thus, Estragon’s new fractional ownership is equal to approximately 17.0% (= 13.33% × (45 /50)+(2.5/50)).

The positive correlation and positive real return, however, translates into a poor inflation hedge because the annual volatility of real return is high. Exhibit 33 shows that the annual volatility of an average spot commodity is 27.55%, which is comparable to the volatility of equity market returns and drives the geometric mean excess return down to -0.93%.</p>	<p>Exhibit 33 shows that spot commodity real returns are also positive. The positive correlation and positive real return unfortunately fail to translate to a good inflation hedge as the annual volatility of the real return is high. As exhibit 33 also shows that the annual volatility of an average spot commodity is 27.55%, which is comparable to the volatility of equity market returns and drives the geometric mean excess return down to -0.93%.</p>

<p>5 Mar 2026</p>	<p>5: Preserving the Wealth</p>	<p>5.05 Exchange Rate Risk</p>	<p>Page 372 Below Exhibit 38</p>	<p>Displaying the family balance sheet in this way reveals currency mismatches between assets and liabilities. The risk of that mismatch is compounded by exchange rate volatility. If we consolidate all the dollar-denominated assets into one category and all the euro-denominated assets in another (and similarly consolidate the liabilities by currency) and express them all in the same currency as we have done in Exhibit 39, we see currency risks. The USD1.55 million of dollar-denominated assets offsets only a small portion of the currency exposure of the dollar-denominated liabilities and surplus (USD6,900,000 + USD1,910,000 = USD8,810,000). The bulk of the Hemmingworths' assets (USD8.36 million) are denominated in euros, which more than offsets the currency exposure of the USD1.1 million worth of euro-denominated liabilities, including their mortgage and lifestyle. In other words, the Hemmingworths are long euros and short US dollars. They have a USD7.26 million mismatch in their euro exposure (i.e., USD8,360,000 – USD1,100,000).</p>	<p>Displaying the family balance sheet in this way reveals currency mismatches between assets and liabilities. <p>5 Mar 2026</p>	<p>5: Preserving the Wealth</p>	<p>5.05 Exchange Rate Risk</p>	<p>Page 373 Below Exhibit 39</p>	<p>For the Hemmingworths, euros are the base currency, and US dollars are the price currency, or currency in which most of their consumption is based. A 10% depreciation in the euro relative to the US dollar, for example, would decrease the Hemmingworths' surplus by USD726,000 (i.e., $0.10 \times [\text{USD}8,360,000 - \text{USD}1,100,000]$), or about a third of their surplus.</p>	<p>For the Hemmingworths, euros are the base currency, and US dollars are the price currency, or currency in which most of their consumption is based. A 10% depreciation in the euro relative to the US dollar, for example, would decrease the Hemmingworths' surplus by USD836,000 (i.e., $0.10 \times [\text{USD}9,460,000 - \text{USD}1,100,000]$), or just over a quarter of their surplus.</p>
<p>7 Aug 2025</p>	<p>5: Preserving the Wealth</p>	<p>Practice Problems</p>	<p>Page 383 Question 16</p>	<p>Formulate steps a prudent wealth advisor should recommend to help Mr. Young maximize the benefits from his anticipated multi-million US dollar income resulting from the contract with the Japanese corporation?</p>	<p>Mr. Young also expects a multi-million-dollar payout from an existing contract with a Japanese corporation. Formulate steps a prudent wealth advisor should recommend to maximize his after-tax wealth and long-term objectives?</p>

<p>7 Aug 2025</p>	<p>5: Preserving the Wealth</p>	<p>Practice Problems</p>	<p>Page 387 Solution to Question 17</p>	<p>B is the correct answer. In choosing a new country of residence, Mr. Young’s optimal tax system—either Residence Jurisdiction or Source Jurisdiction—depends on several factors, such as his non-US citizenship, EU citizenship, and the assumption of stable tax rates. In a Residence Jurisdiction, he would be taxed on his worldwide income in both the United States and his new residence. This includes income from all sources, not just the United States. Under Source Jurisdiction, taxation focuses on the income’s origin. In the United States, this means taxing only income earned within the country, regardless of Mr. Young’s citizenship. Income earned outside the United States may escape US taxation. Given constant tax rates in both countries, the choice between these systems isn’t clear-cut. Source Jurisdiction might offer tax advantages, but that depends on various intricate factors. While constant tax rates don’t tilt the balance toward either system, a detailed analysis of tax exposures is essential. Consulting international tax experts is crucial for an informed decision, although Source Jurisdiction could be more beneficial in Mr. Young’s case.</p>	<p>B is the correct answer. When statutory tax rates are identical, the key driver of total tax liability is the size of the taxable income base, not the rate itself. A territorial (source-based) system taxes only income earned within the new country. Consequently, royalties from Mr. Young’s semiconductor IP, offshore portfolio income, and foreign real-estate rents can be recognized outside that jurisdiction, keeping them out of its tax net. A residence-based system, however, applies the same rate to all worldwide income; foreign-tax credits merely prevent double taxation—they do not lower the single-country bill. With rates held constant, taxing a smaller base (territorial system) will always produce a lower liability than taxing a larger base (residence system). While treaty relief, sub-national taxes, and compliance costs still warrant professional advice, the territorial approach remains more advantageous to Mr. Young as long as the statutory rates are equal under both regimes.</p>
